

CASE STUDY:

THE PARTNER: Precious Plate, Electroplating Services

For nearly 50 years, Precious Plate has been an industry leader in electroplating services, with extensive experience in stamping and perforating wide stock materials for the Aerospace, Military and Automotive industries. Offering finishes in nickel, copper and tin, Precious Plate has consistently demonstrated both a commitment to minimizing environmental impact as well as ensuring safety for its labor force.

THE PROBLEM:

Precious Plate's internal safety committee observed a secluded workspace within their facility. They became concerned that lone workers were too far removed from the rest of the plant's employees in case of accident, illness, trip and fall, etc.

THE SOLUTION:

Precious Plate provided emergency alert pendants with built-in fall detection for staff members working in this remote area of the plant. If help is ever needed, either the employee presses the button or the automatic fall detection sends an alert, and Company supervisors are immediately notified.

THE RESULT:

Ken Russell, Environmental Health and Safety Manager, reports, "It's a very simple and effective way to communicate for assistance. Push a button and help is on the way. The whole process in our last test run took about 1.5 minutes from hitting the button to someone being there with the individual."

Even better, Ken adds, "Our staff was very excited and appreciative that we obtained this safety device and that the Company cared about the wellbeing of employees. The folks at Alert1 are very good people to work with-- very professional, and assisted in all aspects of getting this system up and running, giving us immediate protection for our people."
